"Explain what a large language model is."
A large language model (LLM) is an artificial intelligence system that learns patterns in human language by training on vast amounts of text. Instead of memorizing answers, it learns statistical relationships between words, phrases, and ideas, allowing it to generate and understand language in a flexible way.
Here's how it works at a high level:
1. Training: The model is exposed to billions or trillions of words from books, articles, websites, and other text. During training, it repeatedly tries to predict the next word in a sequence and adjusts its internal parameters based on its mistakes.
2. Learning patterns: Over time, the model develops an internal representation of grammar, vocabulary, facts, reasoning patterns, and writing styles. It does not "understand" language the way humans do, but it becomes very good at recognizing and generating likely sequences of text.
3. Generating responses: When you type a prompt, the model processes the input and predicts one token (a word or part of a word) at a time. Each prediction is based on the prompt and the tokens it has already generated, producing coherent sentences and longer responses.
LLMs can perform many tasks without being explicitly programmed for each one, including:
- Answering questions
- Summarizing documents
- Translating between languages
- Writing stories, emails, or code
- Explaining concepts
- Assisting with brainstorming and problem-solving
However, they also have limitations:
- They can produce incorrect or fabricated information with confidence.

conversational.
Examples of large language models include OpenAI's GPT series, Google's Gemini, Anthropic's Claude, and Meta's Llama. These models differ in their architecture, training methods, and capabilities, but they all rely on the same core idea: learning language patterns from large-scale text data to predict and generate human-like text.
Today 10:57 AM
A Foundation Model in AI refers to a model like GPT-3, which is trained on a
large dataset and can be adapted to various tasks. Explain what BERT is in this context.
In the context of foundation models, BERT (Bidirectional Encoder Representations from Transformers) is another important example of a large, pretrained language model.
- BERT is pretrained: Like GPT-3, BERT is trained on a very large text dataset before being adapted to specific tasks.
- It uses the Transformer architecture: BERT is built primarily from the Transformer encoder.
- It is bidirectional: BERT looks at the words before and after a particular word simultaneously. This helps it understand context. For example, in "I went to the bank to deposit money," BERT can use the surrounding words to understand that bank refers to a financial institution.
- It is mainly designed for understanding text: BERT is particularly effective for tasks such as text classification, sentiment analysis, question answering, and named-entity recognition.
- It can be fine-tuned: After pretraining, BERT can be adapted to a particular task using a smaller task-specific dataset.
BERT vs. GPT

BERT vs. GPT
The key distinction is their original design:
BERT
GPT
Primarily uses the Transformer encoder
Primarily uses the Transformer decoder
Bidirectional context
Traditionally processes context left-to-right for generation
Strong at understanding/classifying text
Strong at generating text
Commonly fine-tuned for specific language tasks
Can generate long-form responses and content
So, BERT is a foundation-model-style pretrained language model whose main strength is understanding the context of text, whereas GPT-style models are particularly oriented toward generating text.
Foundation Models such as GPT-3 are used for natural language processing,
while models like DALL-E are used for image generation.How are Foundation Models
used in the field of robotics?
Foundation models are increasingly used in robotics to give robots more general-purpose abilities, rather than designing a separate AI system for every individual task.
Here are some key applications:

Foundation models are increasingly used in robotics to give robots more general-purpose abilitie
than designing a separate AI system for every individual task.
Here are some key applications:
1. Understanding instructions
A language foundation model can interpret commands such as "Pick up the red cup and place it on the table." It can translate the instruction into a sequence of actions.
2. Perception and vision
Vision foundation models help robots identify and understand objects, people, environments, and spatial relationships using cameras and other sensors.
3. Planning and decision-making
Foundation models can break a high-level goal into smaller steps—for example:
"Make me a cup of coffee" → find cup → locate coffee → fill cup → operate machine → bring coffee.
4. Learning new tasks
Instead of programming every behavior manually, robots can use pretrained models and demonstrations to adapt to unfamiliar tasks or environments.
5. Vision-language-action (VLA) systems
Newer robotics foundation models combine vision, language, and physical actions. They can connect what a robot sees with natural-language instructions and determine appropriate motor actions.
In simple terms
A traditional robot might be programmed to perform one specific task. A robot using a foundation model can potentially understand many different instructions, recognize unfamiliar objects, and figure out how to accomplish new tasks.
So, just as GPT-style foundation models provide a g al foundation for language and DALL-E provides one for image generation, robotics foundation models provide a general foundation for perception, reasoning, planning, and action in the physical world.

A high school student needs to email their teacher to ask for the homework assignment they missed because they were absent from class due to a cold. write a formal mail
Edit
Request for Missed Homework Assignment
Dear [Teacher's Name],
I hope you are doing well. I was absent from class because I was unwell with a cold and was unable to attend the lesson.
Could you please share the homework assignment or let me know what work I need to complete? I would like to catch up on the missed work as soon as possible.
I apologize for any inconvenience and appreciate your understanding.
Kind regards,
[Student's Name]

Summary and transformation report with original vs output.
Summary and Transformation Report
1. Article Abstract
Original:
India is rapidly expanding its renewable energy sector, particularly through solar and wind power, to meet rising electricity demand and reduce dependence on fossil fuels. This growth is creating economic and employment opportunities, but challenges such as energy storage, grid infrastructure, land availability, and financing remain. Continued investment in clean-energy technology, modern infrastructure, and effective policies will be essential for building a sustainable and secure energy future.
Output Summary:
India is expanding renewable energy, especially solar and wind, to meet energy needs and reduce fossil-fuel dependence. While this creates economic opportunities, challenges such as storage, infrastructure, land, and financing remain. Continued investment and effective policies are necessary for a sustainable energy future.
Transformation: Long abstract → Short, concise summary.
2. Formal Email
Original:
A high school student needs to email their teacher to ask for the homework assignment they missed because they were absent from class due to a cold.
Output:
Subject: Request for Missed Homework Assignment
Dear [Teacher's Name],
I hope you are doing well. I was absent from class because I was unwell with a cold and could not attend the lesson.
Could you please share the homework assignment that I missed? I would like to complete the work and catch up with the class as soon as possible.
Thank you for your understanding and support.
Kind regards,
[Student's Name]
[Class/Section]
Transformation: Informal situation → Formal, polite, and structured email.
Overall Result
The article abstract was summarized by removing unnecessary details while keeping the main ideas, whereas the email was transformed from a simple situation description into a professional message with a subject, greeting, clear request, and closing.

give a c++ code for insertion of node
Here is a simple C++ program to insert a node at the beginning of a singly linked list:
C++
#include <iostream>
using namespace std;
struct Node {
int data;
Node* next;
};
void insertAtBeginning(Node*& head, int value) {
Node* newNode = new Node();
newNode->data = value;
newNode->next = head;
head = newNode;
}
void display(Node* head) {
while (head != nullptr) {
cout << head->data << " -> ";
head = head->next;
}
cout << "NULL" << endl;
}
int main() {
Node* head = nullptr;
insertAtBeginning(head, 30);
insertAtBeginning(head, 20);
insertAtBeginning(head, 10);
cout << "Linked List: ";
display(head);
return 0;
}
Output:
Linked List: 10 -> 20 -> 30 -> NULL
Logic: Create a new node → point it to the current → make the new node the new head.

```
#include <iostream>
using namespace ;
{
   int data;
   Node* next;
};

void insertAtBeginning(Node*& head, int value) {
   Node* newNode = new Node();

   newNode->data = value;
```

Show more

There are **3 main errors** in your C++ code:

1. Incorrect `using namespace`

You wrote:

```cpp
using namespace ;
```

It should be:

```cpp
using namespace std;
```

2. `Node` structure is missing

You have:

```cpp
{
    int data;
    Node* next;
};
```

You need to define the structure using `struct Node`:

```cpp
struct Node {
    int data;
    Node* next;
};
```

3. You forgot to update `head`

Inside `insertAtBeginning()`, you correctly create the new node and connect it to the old head, but you don't make the new node the new head.

Add:

```cpp
head = newNode;
```

create a 5 mcq quize for sppu se aids engg for the subject AI on unit 1

SPPU SE AI&DS – Artificial Intelligence Unit 1 MCQ Quiz

Instructions: Choose the correct option for each question.

1. What is Artificial Intelligence?

A. A technology used only for creating websites
B. The ability of machines to perform tasks that normally require human intelligence
C. A programming language
D. A database management system

2. Which of the following is an example of AI?

A. A basic calculator performing `2 + 2`
B. A traditional light switch
C. A voice assistant understanding and responding to spoken commands
D. A simple digital clock

3. Who is commonly known as the "father of Artificial Intelligence"?

A. Alan Turing
B. John McCarthy
C. Charles Babbage
D. Tim Berners-Lee

4. Which of the following is a major component of an intelligent agent?

A. Sensors
B. Keyboard only
C. Printer
D. Monitor

5. What is the main goal of an intelligent agent?

A. To maximize its performance measure
B. To store files permanently
C. To increase computer memory
D. To replace the operating system

Answer Key

Question	Answer
1	B
2	C
3	B
4	A
5	A
